The pneumatic open / close stroke control valve signals the locking jaws end-of-stroke positions, both in fully opened and fully closed positions.

The valve needs a pneumatic line with **filtered and lubricated air and a pressure of 0,5-1 bar**.

- when the locking jaws are in one of the end stroke position (fully opened or closed), the valve is open causing a pressure drop in the pneumatic line or the beginning of an air flow.
- when the locking jaws are in the working stroke, the valve is closed and there is no pressure drop in the pneumatic line and there no air flow.

ONLY THE PTP AND PTH VISES

The vises can be supplied (when requested) with the **opposite functioning** of the valve: that is closed valve at the end of the strokes and open in the working / middle stroke.

Safety valve SAB-1

(OPTIONAL)

Pneumatic gun

with steel nozzle

Id. No.
41702140

The Safety valve SAB-1 maintains air pressure in the cylinder pallet transportation / storage or machining without feed.
